RAPID IMMUNE RECOVERY SYNDROME

The second law of thermodynamics based LOW ENTROPY COPPER formulation states that there will be no rapid immune recovery syndrome among the patient who uses the low entropy copper to destroy the virus, bacteria and fungus, since the low entropy copper never manages the cd4 count or any of the body's defense against the microorganisms. Its like your state is attacked by the enemy soldiers and you are using external soldiers to get rid of the enemy without using your own soldiers. In this case cd4 count rises slowly only naturally. The rise of the cd4 count is the secondary phenomenon. You have used external army like low entropy copper having very large energy packet to destroy the microorganisms which incidentally results in the rise of cd4 count.so the sudden rise of cd4 will never happen and the question of rapid immune recovery syndrome will not happen. You are letting the cd4 to recover slowly and naturally, any way there is hardly any enemy to fight.

But the present Antiretroviral based therapy micromanages the virus or your enemy into a jail like lymph .the sudden micro management of virus and cd4 count results in sudden jump in cd4 count which attacks the some escaped virus and your own cells in the process which results into RAPID IMMUNE RECOVER SYNDROME. The main problem of virus is never addressed. You are addressing the cd4 issue only. Rapid immune recovery syndrome
